1. Overview of Rajkot Rajpath Limited (RRL)

1.1 Socio-economic profile of the city

Rajkot is a key economic and industrial centre in the Saurashtra region with a population of around 2 million and is supported by a well-developed commercial and industrial base. Its strategic location has enabled the city to emerge as a major hub for trade and manufacturing, particularly in agricultural commodities, machine tools, foundries, engineering goods, automotive components, gold and silver jewellery, and handicrafts. The presence of large industrial estates such as Aji Industrial Estate, Bhaktinagar Industrial Estate, Shapar-Veraval GIDC, and Metoda GIDC has generated substantial employment opportunities, attracting a skilled and diverse workforce from neighbouring districts and states.

Rajkot also serves as an important regional service and mobility hub, with significant daily movement of people from nearby towns and villages through public and intermediate transport systems. These demographic and economic trends have contributed to the city's steady growth and urban expansion, creating opportunities for continued investment in urban infrastructure and mobility systems to support sustainable and inclusive development.

Figure 1 Location of Rajkot

Figure 2 Demographic details of Rajkot

Source: Rajkot Climate Resilient City Action Plan – Towards A Net-zero Future

1.2 Overview of Rajkot's urban mobility systems

Urban mobility in Rajkot is comprising public transport, intermediate public transport, and a high share of personal mobility modes. The city's public bus system is managed by Rajkot Rajpath Limited (RRL), a wholly owned subsidiary of Rajkot Municipal Corporation (RMC), established in 2012 to strengthen and modernise urban transport services in the city.

Rajkot currently has a fleet of 150 electric buses and 100 CNG buses, reflecting the city's continued transition towards cleaner and more sustainable mobility solutions. RRL operates two major public transport systems: the Bus Rapid Transit System (BRTS) and the Rajkot Municipal Transport Service (RMTS), together operating around 224 buses daily and serving approximately 52,000 passengers daily.

The BRTS operates along an 11 km dedicated corridor with 28 buses and has emerged as an efficient and high-capacity mobility spine for the city, carrying nearly 40% of total public transport ridership through its faster travel times, higher operational efficiency, and reliable services. Complementing this, RMTS provides extensive fixed-route and fixed-schedule bus connectivity across the city and peripheral growth areas through a network of approximately 79 routes and 196 buses, enabling wider urban accessibility and regional connectivity.

With continued urban expansion and increasing travel demand, Rajkot is focusing on further strengthening service coverage, operational efficiency, and passenger convenience to enhance the overall attractiveness and usage of public transport systems across the city.

Figure 3 Rajkot city boundary and bus route network

1.3 Overview of existing systems of RRL

Ticketing System: Rajkot's city bus services use Electronic Ticketing Machines (ETMs) and POS-based systems for fare collection across RMTS and BRTS services. Digital fare collection and AFCS-based ticketing data management systems provide a strong foundation for future integration and standardisation of transport data.

Real-Time Tracking of Buses: GPS-enabled On-Board Units (OBUs) are installed across the bus fleet to support real-time vehicle tracking and operational monitoring. RRL is working towards strengthening integrated mobility management and passenger information systems for improved service delivery.

Passes: Rajkot offers bus passes for various commuter categories including students, senior citizens, labour workers, and persons with disabilities, with monthly to annual validity options. Applications and payments are facilitated digitally through the Rajkot Municipal Corporation platform.

Static Data Management: Operational data related to routes, schedules, and duty planning is managed digitally through planning and scheduling tools like Vehicle Planning and Scheduling & Dispatching (VPSD), supporting efficient bus operations and service management across the city.

Performance Monitoring: RRL regularly monitors operational indicators such as ridership, revenue, and service performance through digital systems and operational dashboards like AFCS Dashboard, supporting improved planning and data-driven transport management.

2. RRL Saarthi: Design, Development, and Implementation of the Application

2.1 Project design and stakeholders' consultation

To enhance passenger convenience and promote greater adoption of city bus services, Rajkot initiated the development of a comprehensive journey planning application aimed at providing route information, trip planning support, and expected bus arrival information for passengers.

Extensive stakeholder consultations were undertaken with officials from Rajkot Rajpath Limited, including the IT, operations, and management teams, to finalise the features of the unified mobility application and the Data Analytics Dashboard. Parallel discussions were also conducted with OEMs, technical vendors, and service providers to understand existing IT systems, backend architecture, GPS configurations, and data-sharing mechanisms.

As part of the initiative, route and stop-level datasets were streamlined and standardised in collaboration with RRL to support preparation of GTFS-compliant public transport data and strengthen the foundation for integrated passenger information systems.

A continuous review and coordination process was undertaken with the technical teams of Rajkot Rajpath Limited and OEM partners to strengthen the quality and consistency of static and real-time transport data. Regular discussions and monthly review meetings chaired by senior city officials ensured close monitoring of project progress, data integration efforts, and implementation support requirements.

RRL and OEM partners facilitated regular API-based data sharing, enabling the development team to enhance system integration, data processing, and operational analytics. The initiative also involved extensive technical augmentation, data standardisation, and algorithm development to support the successful implementation of the unified journey planning application and the data analytics dashboard.

The following chapter outlines the development process and key features of the journey planning application and the integrated data analytics dashboard.

Figure 4 Stakeholder consultation with RRL field staff

2.2 Application Concept and features

Based on stakeholder consultations, and system requirements, a Journey Planning Application was conceptualised for Rajkot. The application aims to provide accurate, real-time travel information and seamless digital services to improve commuter experience and public transport adoption. Its key features include:

- Digitised Bus Stops, Routes, and Schedules using GTFS
- Real-Time Bus Tracking for all operating buses
- ETA Predictions at each stop
- Journey Planning with alternate route options
- Integrated Payment Gateway for secure digital transactions
- Online Ticket Booking for single journeys
- Digital Pass Purchase (Daily)
- Integration with periodic pass (yearly/special category)
- Operations Dashboard for monitoring ticketing analytics and system performance

2.3 Data Integration & Application Interface

To support the development of modern passenger information and journey planning systems, Rajkot Rajpath Limited undertook a comprehensive initiative to standardise and modernise its static public transport data. Operational information related to routes, stops, schedules, and trip planning was consolidated from multiple digital sources and integrated into a unified and structured database.

A dedicated Static Data Integration Pipeline and GTFS conversion framework were developed to transform existing operational datasets into a standardised GTFS-compliant

format. The initiative included route validation, stop mapping, geo-referencing, and schedule integration in close coordination with RRL officials and technical teams. Accurate stop-level mapping and bi-directional route representation were also established to improve operational precision and passenger information quality.

The initiative has enabled the creation of a reliable and scalable GTFS dataset comparable with global public transport standards, forming the foundation for real-time tracking, journey planning, route visualisation, and future smart mobility integrations across Rajkot's public transport system.

Figure 5 GTFS editor

2.4 Real-Time Data Integration (API integration)

To strengthen intelligent transport systems and passenger information services, Rajkot Rajpath Limited undertook a comprehensive initiative to integrate real-time bus tracking data across both electric and CNG bus fleets operated by different OEM vendors.

As part of the initiative, unified GPS API integration and a centralised real-time data ingestion pipeline were developed to standardise and consolidate live vehicle data from multiple backend systems into a common operational framework. Advanced route prediction and vehicle-mapping algorithms were also developed using scheduling data, depot assignments, and real-time GPS information to support accurate route identification and live bus tracking.

In addition, dedicated operational dashboards including a GPS Data Monitoring Dashboard and Live Bus Tracking Dashboard were developed to enhance operational visibility and system monitoring for RRL.

The initiative has enabled the establishment of a unified real-time tracking ecosystem supporting live bus tracking, ETA prediction, operational monitoring, and improved passenger information services, thereby enhancing both commuter experience and data-driven transport management in Rajkot.

Data Categorization by Timestamp

Figure 6 Assessment of GPS data availability

Figure 7 Live location tracking of the buses

2.5 Integration with Existing Systems (RRL Passes, VPSD, Payment Gateway)

To promote seamless and cashless public transport services, Rajkot Rajpath Limited implemented a comprehensive digital ticketing and pass management system for city bus and BRTS services. The initiative enabled the transition from conventional physical passes to app-based digital mobility services integrated within the unified journey planning application.

A dedicated Digital Pass Module with QR-code-based verification was developed to support digital bus passes, while integrated ticketing infrastructure was introduced for city bus tickets, BRTS tickets, and short-duration travel passes. Digital payment integration was

enabled through Razorpay supporting UPI, cards, wallets, and net banking transactions for passenger convenience.

The system also integrated operational scheduling data with ticketing platforms to improve service coordination and digital fare management.

With this initiative, Rajkot now has a modern multimodal digital ticketing ecosystem that enhances commuter convenience, supports cashless mobility, improves operational efficiency, and strengthens the city's smart public transport infrastructure.

2.6 User interface and Experience Design

To enhance commuter convenience and accessibility, a modern passenger-facing mobility application was developed for Rajkot Rajpath Limited with a strong focus on intuitive design, ease of use, and seamless access to public transport services.

The application was designed with a simplified and user-friendly interface catering to passengers across different age groups and digital literacy levels. Key features such as ticket booking, digital passes, live bus tracking, and journey planning were integrated into a unified home screen for faster and more convenient access.

Enhanced visualisation features including real-time bus tracking, ETA information, route directions, and multimodal journey planning were incorporated to improve passenger information and travel planning.

The application now delivers a modern and integrated commuter experience, enabling passengers to conveniently access live transit information, plan journeys, and use digital mobility services through a single platform, thereby improving overall public transport accessibility and user experience in Rajkot.

2.7 Phased Implementation of the application

The development of the unified mobility platform for Rajkot Rajpath Limited was undertaken through a structured and collaborative process involving static data standardisation, real-time data integration, digital ticketing, dashboard development, and user-centric application design.

The initial phase focused on consolidating and standardising operational data related to routes, stops, schedules, and trip planning from multiple digital sources. In collaboration with Anamar Technologies, a GTFS-compliant database and custom data integration framework were developed to support accurate journey planning, route visualisation, and passenger information services. Stop mapping, directional route validation, and schedule integration were carried out in close coordination with RRL officials and operational teams.

Simultaneously, extensive coordination was undertaken with IT vendor and bus OEM partners to integrate operational schedules, duty information, and GPS-based real-time tracking systems. Advanced route prediction and vehicle-mapping algorithms were developed using duty assignments, operational schedules, and live GPS data, enabling accurate live bus tracking and ETA prediction across both electric and CNG bus fleets.

Following backend system integration, a modern and intuitive passenger-facing mobile application was developed featuring live bus tracking, journey planning, digital ticketing, and digital pass management. Multiple review cycles were conducted with RRL and RMC

officials to validate route information, schedules, and operational workflows. Operational dashboards for fleet monitoring and fare collection analytics were also developed to support real-time operational oversight and data-driven decision-making.

As part of the initiative, branding and identity development for the application were undertaken in consultation with RRL and RMC officials, leading to the formalisation of the “RRL Saarthi” mobility platform. Integrated digital payment infrastructure was also enabled through support for UPI, cards, wallets, and net banking, allowing seamless purchase of tickets and passes through the application.

The project ultimately delivered “RRL Saarthi”, a comprehensive digital mobility platform integrating journey planning, live bus tracking, digital ticketing, and operational analytics into a unified ecosystem.

Figure 8 Logo of RRL Saarthi application

2.8 Feedback and Grievance Mechanism

The Rajkot Municipal Corporation Complaint Management System has been integrated with the “RRL Saarthi” application to ensure seamless grievance redressal and improved citizen support services. All complaints raised through the application are captured within a centralised platform and are monitored through a defined service response framework.

Application-related grievances are managed by Anamar Technologies through a dedicated support mechanism to ensure timely resolution and enhanced user experience. In addition, the platform includes an automated refund management process for digital transactions, ensuring that in cases of unsuccessful ticket issuance or interrupted payment transactions, refunds are processed efficiently and credited back to users within the stipulated timeline.

This integrated grievance and refund management system has strengthened transparency, reliability, and user confidence in Rajkot’s digital public transport ecosystem.

2.9 Capacity Building and Training

As part of the application development and digital integration process, significant emphasis was placed on capacity building and training to ensure that RRL staff could independently operate, manage, and update the new systems.

- A virtual training session was conducted on the GTFS Editor Tool, followed by hands-on support to enable RRL staff to update routes, correct bus stop locations, and maintain static data accurately.
- Dedicated training sessions were also delivered on the use of the real-time bus tracking dashboard, enabling operational teams to monitor live bus locations, data health, and fleet performance.
- Separate training was provided on fare collection monitoring, allowing staff to analyse digital ticketing data, track revenue trends, and address payment-related issues.
- In addition, a Depot Tool was developed to streamline the assignment of routes, duties, and schedules for each bus, for which operational and depot-level teams received structured training.
- functionality and analytical capabilities of the dashboard were explained in detail to RRL staff through a combination of virtual and in-person training sessions, during which officials were guided on interpreting indicators, navigating visualisations, and using insights for day-to-day operational monitoring and performance review

Together, these capacity-building efforts strengthened RRL's ability to manage digital systems effectively and ensured long-term sustainability of the platform.

2.10 Application launch

Figure 9 Features of the RRL Saarthi application

Following final approval of the fully developed application, RRL Saarthi was officially uploaded to the Google Play Store, making it publicly accessible for commuters. The application was then formally launched on 26 January 2025 by the Hon'ble Mayor of Rajkot, marking the city's transition toward a modern, digitally enabled public transport ecosystem and signalling RRL's commitment to enhancing commuter experience through technology-driven mobility solutions.

2.11 Communication and User Engagement

To promote the adoption of the RRL Saarthi application and increase public awareness, a multi-channel outreach strategy was considered. This included advertising at major bus stands and terminals through posters and billboards, displaying promotional content on LED screens owned by the Rajkot Municipal Corporation, and advertisements in local newspapers to reach a wider audience. In addition, QR codes for direct app download were placed at bus stops, enabling easy access for commuters, while radio advertisements and targeted social media posts were proposed to further enhance visibility and encourage widespread usage of the application.

2.12 Public Outreach

For outreach and awareness generation, all communication content and promotional materials were prepared by the GIZ SUM-ACA team, while RRL was deployed these materials effectively across multiple channels to maximise public reach and adoption of the application. A structured outreach strategy was implemented to ensure consistent messaging and wide visibility among commuters.

Figure 10 Poster for RRL Saarthi app promotion

As part of this effort, well-designed infographic-based posters were developed to clearly communicate the key features and overall benefits of the RRL Saarthi application. These posters also illustrated the step-by-step process for downloading and using the application, making it easy for first-time users to understand its functionality. The posters were disseminated through RMC's official social media channels and displayed on LED screens owned by RMC, ensuring high visibility in prominent public locations. In addition, physical posters with QR codes for direct app download were installed at bus stops (all BRTS and high footfall RMTS stops) and terminals (like Trikon baugh), enabling commuters to access the application instantly while waiting for services.

Figure 11 RRL Saarthi promotion

Beyond static advertising, RRL staff undertook on-ground outreach activities, visiting public spaces, colleges, and educational institutions to directly engage with citizens, particularly students, and encourage the use of the application for daily commuting needs. These interactions helped build trust, clarify user queries, and promote practical adoption of the app. Furthermore, the RRL team engaged with local newspapers, resulting in the publication of informative articles highlighting the application's features, benefits, and ease of use, thereby spreading awareness across the city.

Figure 12 Press Coverage about RRL Saarthi application

2.13 Impact of the application

The introduction of the “RRL Saarthi” application has significantly enhanced commuter convenience, digital accessibility, and operational efficiency within Rajkot’s public transport system. With more than 1 lakh downloads and over 11,000 daily active users by March 2026, the application has emerged as the primary digital mobility platform connecting citizens with public transport services in the city.

The increasing adoption of digital ticketing and app-based services has improved passenger movement at BRTS stations by reducing dependency on physical ticket counters and streamlining fare collection processes. Digital pass integration has also enhanced commuter convenience by enabling passengers to securely access and manage bus passes through the application.

Real-time bus tracking and ETA features have strengthened passenger confidence by improving trip planning, reducing uncertainty, and enhancing the overall reliability and transparency of bus services. These improvements have contributed positively to commuter satisfaction and public transport usage.

In addition, the platform incorporates advanced digital verification and secure ticketing features that support improved fare management and operational transparency. Overall, “RRL Saarthi” represents a major step towards modernising Rajkot’s public transport ecosystem through integrated, user-centric, and technology-enabled mobility solutions.
